AMERICAN FORESTS
A History of Resiliency and Recovery
by Douglas W. MacCleery
Many of today’s forestry debates hinge on “how much there is” and “how much there was.” American Forests documents the changes our nation’s forests have experienced from colonial times to the present. It presents a baseline for discussion. Included in this 58-page text are the extent of U.S. forests prior to European settlement; native American peoples’ effects on the forest; population and agricultural expansion; uses of the forest for fuel, ironmaking, transportation, and expanded lumber production; and early conservation efforts. It contains 13 photographs and 18 tables. Four-color cover.

FOREST PHARMACY
Medicinal Plants in American Forests
by Steven Foster
The identification of taxol as a potential cancer fighting compound highlighted American interest in plant-derived medicines. The bark of the Pacific yew, a relatively neglected though not rare tree, is the source for taxol. Once scientists discovered taxol’s effect, the need for a sustainable supply of the raw material became clear. The balance between resource extraction and human benefit took center stage. This booklet identifies 120 trees, herbaceous plants and shrubs listed for their medicinal values. Another 14 plants are discussed in detail including ginseng, goldenseal, passionflower, mayapple, bloodroot, and others. Contains 17 photographs and 4 tables. Four-color cover.

NEWSPRINT
Canadian Supply and American Demand
by Thomas R. Roach
Newsprint documents the growth of the Canadian newsprint industry and its traditional reliance on U.S. markets. In more recent years, significant market shifts, a strong Canadian dollar, and environmental concerns have brought newsprint’s future into question. The author discusses export restrictions and tariffs; government intervention, the changing structure of Canadian forests; international competitiveness and new approaches to fiber production. The 56-page volume includes 19 color figures and 7 tables. Four-color cover.

AMERICA’S FIRES
Management on Wildlands and Forests
by Stephen J. Pyne
Fire is at the heart of many forest health and sustainability issues being discussed today. Written by the authoritative expert on the subject, this booklet documents the extraordinarily successful twentieth century campaign to prevent and suppress wildfire and forest fires. Ironically, this fire exclusion has altered ecosystems in ways that increase forest susceptibility to fires and also to insect attacks. Healthy forests in America require fire. At the same time urban expansion into wildland areas has caused logistical nightmares in fighting wild fires. The result, in some cases, has been saving individual homes while fires rage on to destroy valuable timber and recreational resources. Contains 83 pages, 22 photographs, and 11 figures and graphs. Four-color cover.

Forest History Society Issues Series
The Issues Series published by the Forest History Society are booklets that bring a historical context to today’s most pressing issues in forestry and natural resource management. FHS invites authors of demonstrated knowledge to examine an issue and synthesize its substantive literature. The Issues Series—like its Forest History Society sponsor—is non-advocacy. The series aims to present a balanced rendition of often contentious issues. They are attractive, informative, and easily accessible to the general reader.
